**Understanding Analysis and its Connections to Secondary Mathematics Teaching** Nicholas H. Wasserman, Timothy Fukawa-Connelly, Keith Weber, Juan Pablo

Mejía Ramos, Stephen Abbott, 2022-01-03 Getting certified to teach high school mathematics typically requires completing a course in real analysis. Yet most teachers point out real analysis content bears little resemblance to secondary mathematics and report it does not influence their teaching in any significant way. This textbook is our attempt to change the narrative. It is our belief that analysis can be a meaningful part of a teacher's mathematical education and preparation for teaching. This book is a companion text. It is intended to be a supplemental resource, used in conjunction with a more traditional real analysis book. The textbook is based on our efforts to identify ways that studying real analysis can provide future teachers with genuine opportunities to think about teaching secondary mathematics. It focuses on how mathematical ideas are connected to the practice of teaching secondary mathematics—and not just the content of secondary mathematics itself. Discussions around pedagogy are premised on the belief that the way mathematicians do mathematics can be useful for how we think about teaching mathematics. The book uses particular situations in teaching to make explicit ways that the content of real analysis might be important for teaching secondary mathematics, and how mathematical practices prevalent in the study of real analysis can be incorporated as practices for teaching. This textbook will be of particular interest to mathematics instructors—and mathematics teacher educators—thinking about how the mathematics of real analysis might be applicable to secondary teaching, as well as to any prospective (or

current) teacher who has wondered about what the purpose of taking such courses could be.

*Tutorial Essays in Psychology* N. S. Sutherland, 2014-01-14 First published in 1979. The aim of this series of Tutorial Essays, of which the present book is the second volume, is to enable the specialist in one area to discover in as painless a way as possible what his colleagues in other parts of the field are up to: New discoveries, methods and theories in one speciality often have important implications for work in others. The essays are also intended to be intelligible and useful to graduate students and advanced undergraduates seeking an introduction to a topic. In this volume Bow Lett describes modern work on an old topic, delay learning in animals, and discusses its implications for theories of learning. Mark Georgeson expounds an important new approach to vision, the application of Fourier analysis: His chapter contains an exceptionally clear exposition of the ideas underlying this technique written for the reader with little mathematical knowledge. Dennis Holding provides a synthesis of the many different approaches to the problem of echoic memory, and Gregory Jones presents some new ideas on associative memory which make many previously puzzling results fall into place.
